The 60-Second Version

IF YOU HAVE ONE MINUTE BEFORE GETTING BACK TO WORK, THIS IS THE PART YOU read. Five facts, in order of weight. Each one is unpacked later in the brief.

THE FIVE FACTS

1. Your site ranks for **132 keywords** with **~344 estimated monthly clicks** today — **3** in positions 1–3, **15** in 4–10, and **80** sitting in the 11–50 conversion band where this sprint earns its keep.
2. Three cannibalization clusters are blocking all new work: **Cluster A** ([www](#) + apex both rank, 13 vs 59 keywords splitting authority), **Cluster G** (two coexisting location-slug patterns), and **Cluster H** (duplicate </blog/trex-vs-timbertech-vs-azek>). All three ship by Day 3.
3. Two Tier-4 hubs anchor the publishing slice: **/services/deck-repair/** targeting **deck repair** (9,900 SV, KD 0) and a **TimberTech material hub** targeting **timbertech decking + timbertech decks** (22,200 SV each, KD 0–9). Your Trex Platinum + TimberTech Platinum certifications are the Information Gain a generalist cannot fake.
4. The local-pack is the revenue surface. Your **5.0★ Google rating** is the strongest E-E-A-T signal in the NoVA deck-builder competitor set — weaponize it through GBP completeness, weekly post cadence, named-reviewer photo replies, and consistent NAP across BBB, Houzz, Angi, Yelp, and the Virginia Class-A registry.
5. 90-day targets (white-hat, no guarantees): **/services/patios/** rewrite reaches *top-20* for at least one of three 5,400-SV combo terms; **3 of 15 Tier-2 keywords** push from 4–10 into top-3; **/services/deck-repair/** reaches top-30 within 60 days of publish, top-10 by Day 90 only if real photos and named technician ship with it.

WHY THIS IS GOOD NEWS

The data points say this is a small site with a defensible footprint, not a damaged one. Three brand-geo wins at the top, 80 keywords already in Google's evaluation band, two hub opportunities with **KD 0** in the local SERP, and two real Platinum certifications behind every recommendation. None of the next 90 days require new authority — they require stopping the splits, refreshing what already ranks, and shipping the two hubs honestly.

A small, defensible site sitting on three brand-geo top-3 wins and a 132-keyword footprint — this is the baseline every Day-30 number compares against.

KEYWORDS RANKING 132 <i>across 27 URLs</i>	POSITIONS 1-3 3 <i>brand-geo wins</i>	POSITIONS 11-50 80 <i>the conversion band</i>	EST. MONTHLY CLICKS ~344 <i>DataForSEO ETV sum</i>
---	--	--	---

Where you already win (positions 1-3)

KEYWORD	POSITION	MONTHLY SEARCHES	PAGE
loudoun decks builder	#1	90	/
loudoun deck	#2	50	/
decks northern virginia	#3	110	/

Where you almost win (top 5 push targets)

KEYWORD	CURRENT	TARGET	MONTHLY SEARCHES	PAGE
deck contractors northern va	#7	top-3	260	/
deck contractor fairfax va	#8	top-5	90	/deck-builder-in-fairfax-county/

deck companies in northern va	#10	top-3	260	/
timbertech vs azek	#10	top-3	140	/trex-vs-timbertech-vs-azek

All numbers from DataForSEO ranked_keywords pull on 2026-05-11 (site-ranked-keywords-2026-05-11.json, 132 keywords across 27 URLs). Pre-GSC validation — refine after Day 0 access closes.

Three cannibalization clusters are quietly splitting authority across duplicate URLs and host variants. Every new-content idea is parked until they close.

THE MATH

Three blocking clusters: A (host normalization — [www](#) ranks for 13 keywords while apex ranks for 59, splitting the home pillar), G (two coexisting location-slug patterns — [/deck-builder-in-<x>/](#) vs [/top-decks-build-near-you/...](#)), and H (duplicate [/blog/trex-vs-timbertech-vs-azek](#) competing with the apex owner at #4). All three ship by Day 3; no new page goes live until they do.

Cannibalization clusters identified

ID	INTENT	URLS COMPETING	CANONICAL	ACTION
A	Host normalization (home pillar)	ldndecks.com (59 kws) vs www.ldndecks.com (13 kws)	apex	301 www → apex
B	"deck builder" geo variants	home + 6 location pages	distributed	audit H1/title; geo stays on geo page
C	"deck contractor / company" head	home + Fairfax page + advisory page	home + Fairfax	strip head from advisory title/H1
D	"near me" terms	home + power-washing page	distinct intents	resolved — clean
E	Loudoun brand-geo leak	Leesburg page ranks for Loudoun-county query	Loudoun-county page	fix H2/anchor on Leesburg page
F	Screened porch variants (5)	all point to single URL	screened-porch page	resolved — push, don't fix
G	Location-page slug pattern	two slug patterns coexisting	DECIDE Day 1	301 loser pattern; blocks all new location work
H	Trex/TimberTech/AZEK comparison	apex page + /blog/ duplicate + Fiberon 4-way	apex page	301 /blog/... → apex
I	Patio + outdoor living	/services/patios/ + home (NoVA-patio variants)	patios page (head) + home (NoVA modifier)	REWRITE patios page
J	Fence (adjacent)	home + /services/fences/	fences page	title/H1 cleanup — low priority
K	Permit / regulatory	single URL	permit page	resolved — clean
L	NoVA deck-building guide	www variant only	apex	covered by Cluster A fix
M	Cost / pricing	single URL @ #70	cost page	REWRITE (real NoVA cost table)
N		single URL @ #98	DECIDE Day 6	REWRITE or 410

Refresh the 80 keywords already in the conversion band, fix the three clusters that block them, then build two hub pages where the NoVA SERP is genuinely uncontested.

— THE WHOLE STRATEGY IN ONE SENTENCE

The strategy is sequenced, not heroic. **Optimize is the bottleneck** — until host normalization closes and the slug pattern is decided, every new page would just add splitting risk. **Find** already named the demand pockets (deck-repair cluster at 29,700 SV total, KD 0; TimberTech material at 44,400 SV, KD 0–9; patio combo terms at 16,200 SV). **Leverage** runs in parallel from Day 7 through the GBP, NAP, review-velocity, and local-press levers the local-services overlay calls for. **Win** measurement starts at Day 0 the moment GSC, GA4, and GBP access close.

This is FLOW (Find → Leverage → Optimize → Win), the framework I built and open-sourced at github.com/AgriciDaniel/flow. Based on 58 books and 1,700+ pages of 2026 SEO research. For LDN Decks's situation specifically:

Find

A 3,890-keyword NoVA deck-builder universe; you own ~3.4% of it. The headroom is the gap. Three demand pockets to mine: **deck repair** (29,700 SV across the cluster, KD 0, deckguru.com #4–12); **TimberTech material** (44,400 SV across two variants, KD 0–9, sunburstdeck.com #24 — nobody owns it); **patio combo** (16,200 SV across three variants, your patios page already at #38–65).

Leverage

Four off-site moves run in parallel from Day 7. **Lever 1:** GBP completeness 100%, weekly posts, 3+ new photos/week, 24-hour Q&A response. **Lever 2:** NAP-perfect across 9 Tier-1 citations (GBP, Bing, Apple, Yelp, BBB, Houzz, Angi, Trex Find-a-Builder, TimberTech Locator). **Lever 3:** Review velocity — minimum 2 new Google reviews/month, 100% named response rate, no gating. **Lever 4:** One quarterly local-press pitch to NoVA outlets.

Optimize

Sequence: resolve cannibalization (Day 1–3), refresh the conversion band (Day 8–12), rewrite the two thin pages (Day 13–24), publish new hubs (Day 35+ and Day 55+). No new page ships while Clusters A, G, H are open. Every refresh re-runs `/seo-audit`; Critical findings are ship-blockers.

Win

Dual-surface scorecard. **Visibility:** local-pack rank on 10 priority queries (5×5 geo-grid), GSC impressions+clicks on 12 priority URLs, GBP insights weekly, citation consistency monthly, DataForSEO position-bucket re-pull quarterly. **Revenue:** GBP actions, CallRail-attributed form fills, booking events, review velocity, CAC by source. Daily review monitoring → weekly GBP → monthly GSC → quarterly full pull.

Each phase has a detailed brief in your vault. Names in `brackets` map to specific files inside `wiki/flows/`.

DAY 0
2026-05-11

Measurement access gate

GSC verified, GA4 property + standard events firing, GBP Manager access confirmed, CMS admin login confirmed, CallRail account created. *Acceptance:* every box ticked in `Day 0 Measurement Access Gate`. *Effort:* 2–4 hours. Until this closes, every recommendation is advisory.

DAY 1
2026-05-12

Install claude-seo · run first /seo-audit

Save the audit to `.raw/sources/audits/audit-1-2026-05-11.md`. Triage Critical findings into the Implementation Roadmap. *Owner:* Daniel Agrici. *Effort:* 1 hour.

DAYS 1–3
2026-05-12–14

Cannibalization triage — ship the three cluster fixes

Cluster A (`www` → apex 301). Cluster H (`/blog/trex-vs-timbertech-vs-azek` → apex owner 301). Cluster G slug-pattern decision + 301 the loser pattern. *Acceptance:* sitemap reflects single canonical slug pattern; curl tests confirm redirects. *Rollback:* revert 301s at CDN/host level.

DAY 4
2026-05-15

Fix the Cluster E leak

The Leesburg location page is accidentally ranking #30 for *loudoun county typical deck details*. Rewrite the leaking H2/anchor to be Leesburg-specific. *Effort:* 30 minutes.

DAYS 5–7
2026-05-16–18

Citation audit + GBP completeness

Manual audit of 9 Tier-1 citations against current website NAP. GBP completeness check; fill missing fields; set up 4-week post calendar. *Effort:* 4–6 hours.

DAYS 8–12
2026-05-19–23

Tier 1 + Tier 2 refresh queue

Refresh home (named-author block, honest `aggregateRating` from real review count, NoVA permit Information Gain section); refresh `/deck-builder-in-fairfax-county/` (push *deck contractor fairfax va* from #8); refresh `/services/porches/screened-porch/` (push 5 variants from 19–46); extend `/trex-vs-timbertech-vs-azek` with Fiberon. *Effort*: 12–16 hours.

DAYS 13–18
2026-05-24–29

`/services/patios/` rewrite — the biggest Optimize bet

Currently #38–65 for three 5,400-SV head terms. Rewrite to match the browse-and-compare patio intent; add named installer, project gallery, NoVA cost range, FAQ schema with real customer questions only. *Acceptance*: top-20 for one of the three combo terms within 90 days. *Effort*: 8–12 hours.

DAYS 19–24
2026-05-30–
06-04

`/composite-deck-cost-northern-virginia/` rewrite

Real NoVA cost range table, embedded calculator widget (real math), Trex vs TimberTech cost comparison, manufacturer-cited prices with source links and dates. *Acceptance*: top-30 for *cost of a composite deck* within 90 days. *Effort*: 10–14 hours.

DAYS 25–30
2026-06-05–10

E-E-A-T sweep · second `/seo-audit` · 30-day review

Roll out named-author bio across service pages with `Person` schema + LinkedIn. Add `LocalBusiness` with `GeneralContractor` + `ServiceArea` sub-types, accurate hours, honest `aggregateRating` from real Google review count. Run `/seo-audit` a second time and compare to baseline. *Milestone Day 30*: 2026-06-10.

Top Quick Wins

BY TRAFFIC POTENTIAL

Six conversion-band keywords stand out for fastest impact — each lives on a page that already exists and sits within 5–15 positions of the top 10.

KEYWORD	CURRENT	VOLUME	TARGET URL	ACTION	ACCEPTANCE
deck contractors northern va	#7	260	/	refresh home with NoVA permit IG section	top - 3 by Day 60
deck contractor fairfax va	#8	90	/deck-builder-in-fairfax-county/	refresh + Fairfax permit data + named author	top - 5 by Day 60
deck companies in northern va	#10	260	/	same as #1 — piggybacks home refresh	top - 3 by Day 60
timbertech vs azek	#10	140	/trex-vs-timbertech-vs-azek	extend page to 4-way with Fiberon	top - 5 by Day 60
trex vs timbertech vs azek	#4	90	/trex-vs-timbertech-vs-azek	cluster H fix (kill /blog/ duplicate)	top - 3 by Day 60
screen porches contractors	#19	5,400	/services/porches/screened-porch/	refresh — already consolidated, push the 5 variants	top - 10 by Day 90
deck and patios	#38	5,400	/services/patios/	full REWRITE (Day 13–18)	top - 20 by Day 90

WHY THE QUICK WINS ARE REAL

Every keyword in the table above is on a page that **already ranks** for the intent — Google has validated the page-to-query match. Position gain from #7→#3 or #19→#10 is a refresh problem (Information Gain, named author, freshness signals, internal links), not a new-content problem. That makes these the lowest-risk lifts in the 90-day plan.

Two Things You'll Want to Know

1. The conversion band is doing most of the work that isn't showing up in clicks

Eighty of your 132 keywords sit in positions 11–50 (60.6% of the footprint). That bucket is the editorial bet of this whole sprint: it responds to refresh + internal-link + Information Gain interventions far more reliably than building new pages from scratch. The home page alone is at #11–12 for *decks companies* and *deck companies* (6,600 SV each); [/services/porches/screened-porch/](#) holds five variants of the 5,400-SV screened-porch contractor query at positions 19–46 with the consolidation already correct. None of those are new-content problems. They are **refresh-and-push** problems, and the refresh is the cheapest thing on the menu.

The implication: the deck-repair hub and TimberTech hub are real Tier-4 bets, but they are *not* the highest-EV moves on the board for Day 0–30. Refreshing the home, the Fairfax page, the screened-porch page, and the Trex-vs-TimberTech page is.

2. The local-pack and the organic SERP are different surfaces — your 5.0★ advantage only compounds on one of them

For deck-builder queries in NoVA, the organic SERP is fragmented (no NoVA competitor is in the top 20 for *deck builders* at 90,500 SV) and the local-pack is where revenue actually lives. Your 5.0★ Google rating is the strongest single E-E-A-T signal in the NoVA deck-builder competitor set — competitors mostly do not match it — but a rating is wasted without GBP completeness, weekly post cadence, named-reviewer photo replies, and NAP consistency across the 9 Tier-1 citation sources.

The implication: GBP and NAP work is not “supplemental” to the on-page work. For your business model (calls + form fills + booking events, not impressions), it is the dominant lever. The off-site Leverage stage runs in parallel with on-site Optimize from Day 7.

What I'm NOT Promising

I'm telling you this up front because the SEO industry is full of people who promise things they can't deliver.

OUT OF SCOPE FOR THIS ENGAGEMENT

- No #1 ranking guarantees. Targets are top-10 and top-3 — outcomes the work *can* produce, not *will* produce.
- No traffic recovery guarantees. Rankings depend partly on Google's next core-update window, which is out of our hands.
- No mass AI-generated content. No bulk service-area pages, no AI-rewritten guides at scale, no AI-generated FAQs of hypothetical questions.
- No link buying, no PBNs, no link exchanges, no expired-domain purchases for backlink equity.
- No fabricated reviews, no review gating, no employees-as-customers, no review-acquisition vendor without policy audit.
- No fabricated schema. `aggregateRating` reflects real Google reviews only; `reviewCount` is the integer Google shows on your GBP profile.
- No fabricated stats. Every numeric claim cites a primary source or is removed.
- No cloaking, hidden text, doorway pages, keyword-stuffed GBP business names, or fake service areas you don't actually cover.
- No identical content across location pages — every `/top-decks-build-near-you/deck-builder-in-<city>/` ships with real local content or doesn't ship.
- No "one weird trick" framing, schemes, or "Google doesn't want you to know" copy.

WHAT I AM COMMITTING TO

- Ship the three cannibalization fixes (Clusters A, G, H) by Day 3 with rollback documented.
- Push 3 of 15 Tier-2 keywords from positions 4–10 into top-3 by Day 60 (probability uncertain — depends on Google’s update window; commitment is the work, not the rank).
- Rewrite `/services/patios/` and `/composite-deck-cost-northern-virginia/` by Day 24; publish `/services/deck-repair/` by Day 45 with named technician, real NoVA before/after photos, county permit references.
- Publish `/materials/timbertech/` by Day 60 only if TimberTech Platinum certification proof and project gallery are real and shippable.
- Run `/seo-audit` three times across the sprint (Day 1, after Days 13–18 refresh wave, after deck-repair hub publishes). Treat every Critical finding as a ship-blocker.
- Deliver the editorial PDF, the Dual Surface Scorecard, and the populated wiki vault for ongoing operation — everything is auditable and rollback-able.

*Confidence is **earned**, not asserted.*

— FROM THE SHIPPING RULES AT THE ROOT OF YOUR VAULT

Your Next Three Actions

IN ORDER · THIS WEEK

1. **Day 0 (today — 2026-05-11):** close the measurement access gate. GSC verified, GA4 firing standard events, GBP Manager access confirmed, CMS admin login confirmed, CallRail account created. *What this unblocks:* every measurement claim in Section 5 and every “top-3 by Day 60” acceptance criterion. Until Day 0 closes, the rest of this brief is advisory.
2. **Day 1 (2026-05-12):** install claude-seo, run `/seo-audit` against ldndecks.com, save the report to `.raw/sources/audits/audit-1-2026-05-11.md`, and triage Critical findings into the Implementation Roadmap. *What this unblocks:* the technical findings currently marked TBD (Core Web Vitals values, schema validity, internal-link density, slug-pattern decision) move from hypothesis to evidence.
3. **Days 1–3 (2026-05-12 to 2026-05-14):** ship the three cluster fixes — 301 `www` → apex (Cluster A), 301 `/blog/trex-vs-timbertech-vs-azek` → apex owner (Cluster H), decide the location-slug pattern and 301 the loser (Cluster G). *What this unblocks:* every new content move from Day 8 onward. No refresh, no rewrite, no hub publish goes live until these three close.

IF YOU ONLY READ THREE OTHER THINGS IN YOUR VAULT

If you only read three other things in your vault before Day 1, read these:

[[Keyword Targets and Page Map]] for the URL-by-URL action ladder; [[Site Inventory and Cannibalization Map]] for the 27-URL inventory and what each one ranks for; and [[Keyword Cannibalization Ledger]] for the 14-cluster ownership table that the three Day 1–3 fixes resolve.

— Daniel

FOUNDER, AI MARKETING HUB · GITHUB.COM/AGRICIDANIEL/FLOW

If anything in this brief looks wrong, push back. The plan is yours; the brain is here to assist. Read first, write second, verify third — confidence is earned, not asserted.
